Do people who trust automation drive differently?

Trust changes how the drive feels and how fast drivers choose to go - but not how well they avoid obstacles.
Trust = items 2-5 (dependable / reliable / can trust). Views = items 9-12 (enjoyable / easier / frees me up). Orange = control handed back, blue = manual.
Driving simulator, 33 drivers, 8 tracks, 792 obstacle encounters. Yerim Mo
Data: Miles & Strybel (2020), Harvard Dataverse. https://doi.org/10.7910/DVN/BWCCET

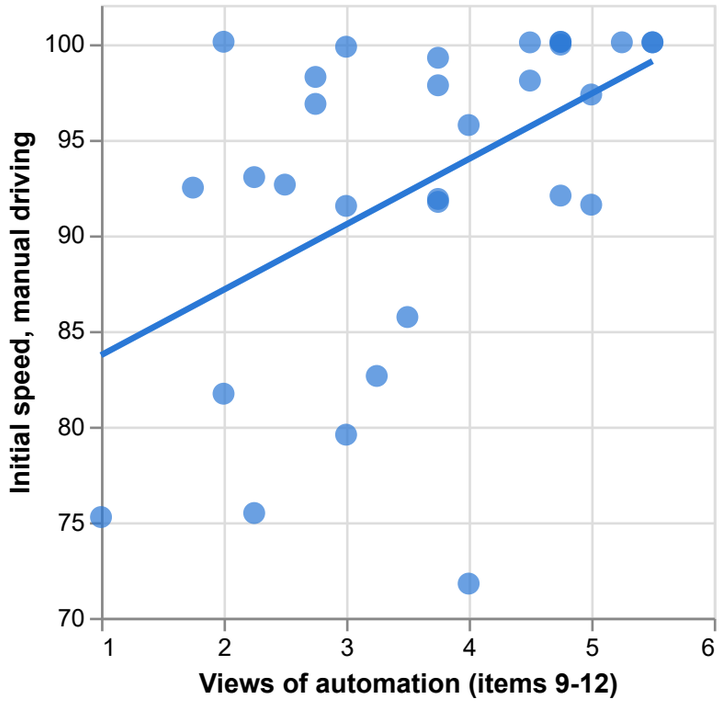

Drivers who trust the system find the hand-off easier

r = -0.50 n = 33

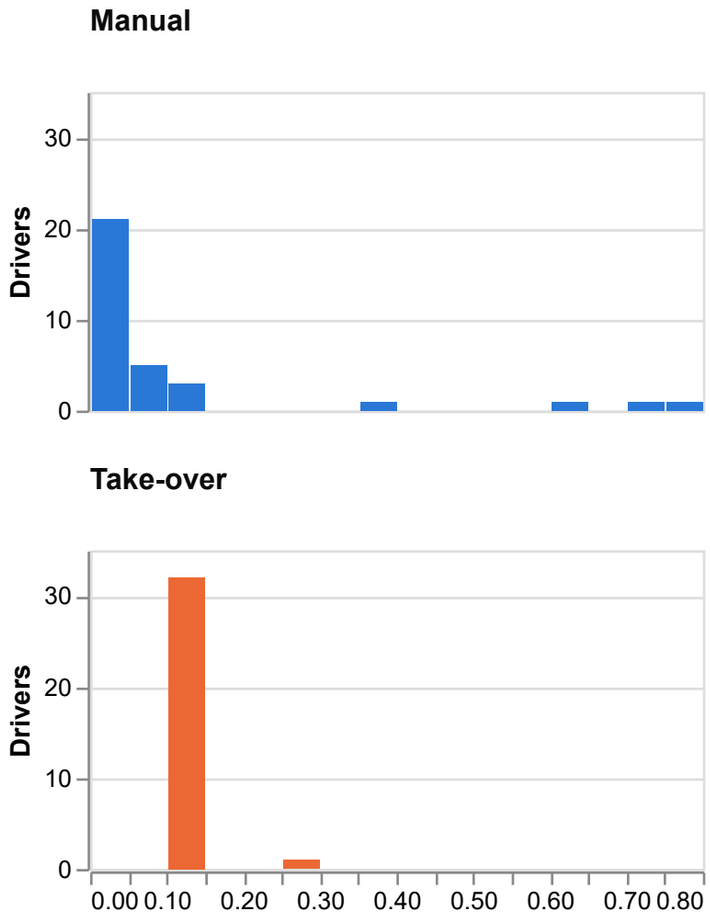

Enthusiasts drive faster when they drive themselves

r = +0.49 n = 31

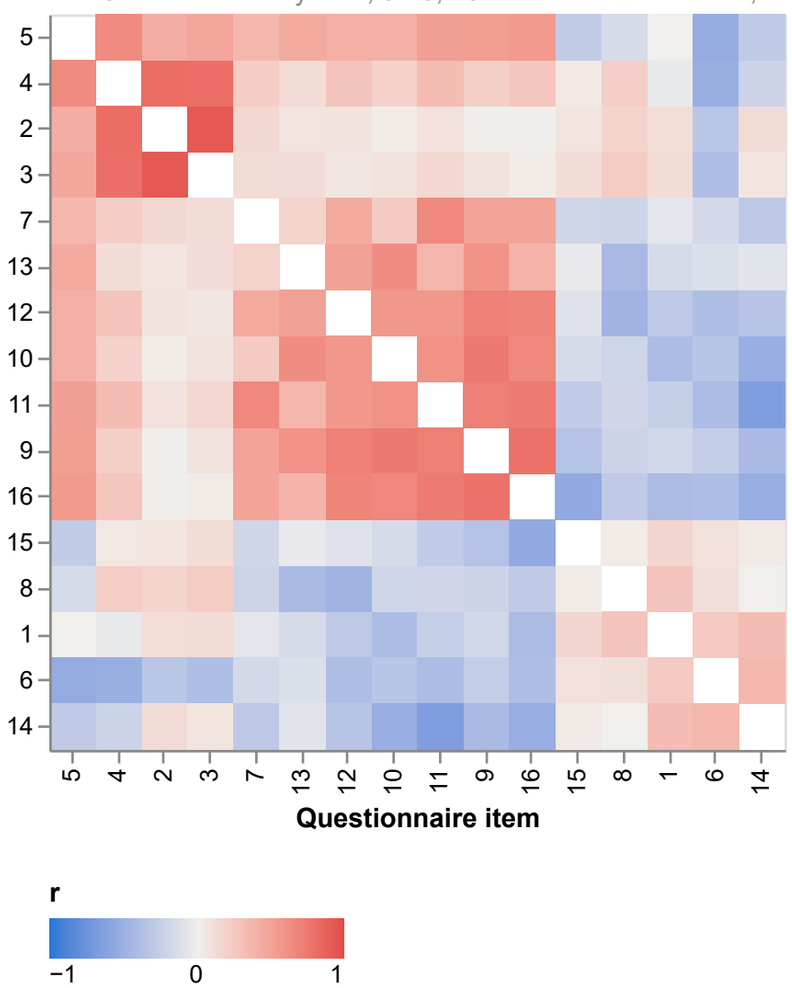

Automation erased the differences between drivers

Each bar counts drivers; n = 33

The questionnaire splits into two blocks

Items 2-5 = trust in the system; 9-13, 16 = views of automation; n = 33

Trust and enthusiasm predict different things

r = +0.29 between the two scales, so they are not the same measure
